Element Paramaterization
Posted by Carie Deatherage - 2010/03/19 13:49

_____

I'm running the kineros model and when I get to the "Element Parameterization" choice I receive an error "FormParameterizerElements.New() Exception from HRESULT: 0x80040258"

This error started just this week and is now an error on 2 of our computers.

Any suggestions?

Thanks,
Carie

_____

Big thanks to Shea for already fixing my problem!

The fix is that the home directory was set to be a different location than where the discretization files were saved. So now my home directory is just c:agwa2 and everything works.

Hi Carie,
Glad I was able to resolve your problem, but to avoid confusion to others let me revise what the solution actually was.

We set the HOME directory to the location that the Datafiles.zip file was extracted to. So in this case, Carie had extracted the Datafiles.zip to C:AGWA2 but had set her HOME directory to something different. What is important is that the HOME directory and the location that Datafiles.zip was extracted to are the same, but the location itself is not important. Also, the Workspace that is set in the Delineator form is completely independent of the HOME directory.
